Hello,

the PreviousMapFeatureGenerator remebers the last outcome (Begin of
name, Inside a name,
outside a name) for a token in all previous sentences. It shoud be
cleared after the end of a document
with a call to the name finders clearAdaptivData method.

Subject: Re: init tokenizer fails: "Bad type in putfield/putstatic"
Message-ID: <1393363252.28814.YahooMailNeo@web140906.mail.bf1.yahoo.com>
Folder: Début du fichier de données Outlook

That message came from 1.5.3.

The stack trace:

```
Exception in thread "main" java.lang.VerifyError: (class: opennlp/model
/GenericModelReader, method: checkModelType signature: ()V) Bad type in
putfield/putstatic
at opennlp.tools.util.model.GenericModelSerializer.create
(GenericModelSerializer.java:35)
at opennlp.tools.util.model.GenericModelSerializer.create
(GenericModelSerializer.java:31)
at opennlp.tools.util.model.BaseModel.loadModel(BaseModel.java:231)
at opennlp.tools.util.model.BaseModel.<init>(BaseModel.java:181)
at opennlp.tools.tokenize.TokenizerModel.<init>(TokenizerModel.java:125)

        ....  code to call the above.
```

In addition, Eclipse tells me: "Source not found".

(p.s. I should have subscribed before sending the question, but hopefully will catch up.)

The above in response to:

Hello,

in which version do you get the error? Is that printed out by 1.5.3 or by 1.3?
Did you get an exception? If so please post the full stack trace.

In the course of the development the training data used to train the English models
was extended and improved when errors came up.

To give it a fair comparison you should use the same training data for
both versions.

Hi,

Is there documentation on the existing features generators? In particular I am looking at PreviousMapFeatureGenerator, trying to get my head around it but not sure if I understand what it is.

Thanks
Ken

[https://issues.apache.org/jira/browse/TIKA-1250?page=com.atlassian.jira.plugin.system.issuetabpanels:comment-tabpanel&focusedCommentId=13912806#comment-13912806]

Gary Murphy commented on TIKA-1250:

The process is looping in ChmLzxBlock around line 613. I put in this hack to allow the process continue, but I wouldn't expect this to be the correct solution:

```
                    int iterations = 0;
                    do {
                        x++;
                        z <<= 1;
                        z += getChmSection().checkBit(x);
                        iterations++;
                        if (iterations > 1024) {
                           throw new TikaException("Data cycle in the file contents");
                        }
                    } while ((z = pretreetable[z]) >= ChmConstants.LZX_MAINTREE_TABLEBITS);
```

I have a file that will reproduce the problem, but I don't see now to attach this to the record.

[Webinar] - Introducing Couchbase Server 2.5:Better Reliability and Security for Enterprises

LIVE WEBINAR: February 26, 2014 at 10am PST

Register now

Curious to know what's new in Couchbase Server 2.5? Couchbase Server is a NoSQL document database for interactive apps. The latest 2.5 Couchbase Server release is here and includes several exciting features in areas like reliability, security and connection management. With this release, enterprises can use rack zone awareness and secure cross datacenter for better reliability and security. In this webinar, you'll also get to see a hands-on tour of the new features in Couchbase Server with a live demo.

- What is rack-zone awareness in Couchbase Server and how it can be used for increased reliability and availability.
- How you can use secure cross datacenter replication for enhanced security on-the-wire when data is replicated from one datacenter to another, and
- How better connection management in Couchbase Server 2.5 can help you support many more clients, thus enabling higher scale.

See you there!

Sincerely,
The Couchbase Team
